FACULTY OF ENGINEERING

DATA MINING & WAREHOUSEING
LECTURE-05

MR. DHIRENDRA

ASSISTANT PROFESSOR

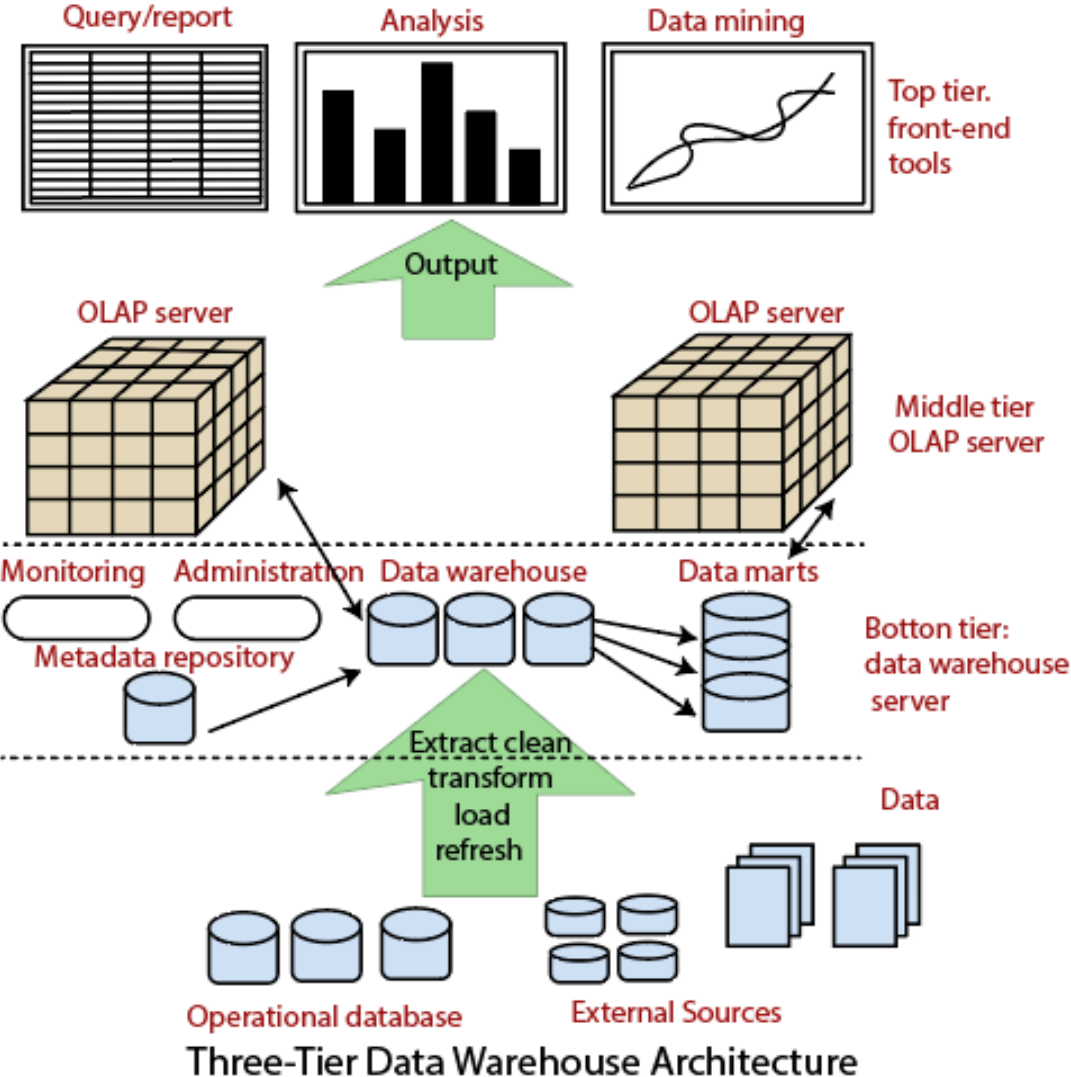

RAMA UNIVERSITY

OUTLINE

- ❖ **THREE-TIER DATA WAREHOUSE ARCHITECTURE**
- ❖ **BOTTOM TIER (DATA WAREHOUSE SERVER)**
- ❖ **MIDDLE TIER (OLAP SERVER)**
- ❖ **TOP TIER (FRONT END TOOLS).**
- ❖ **PRINCIPLES OF DATA WAREHOUSING**
- ❖ **MCQ**
- ❖ **REFERENCES**

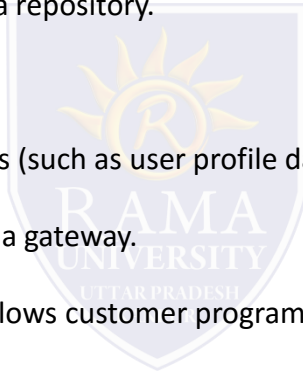

THREE-TIER DATA WAREHOUSE ARCHITECTURE

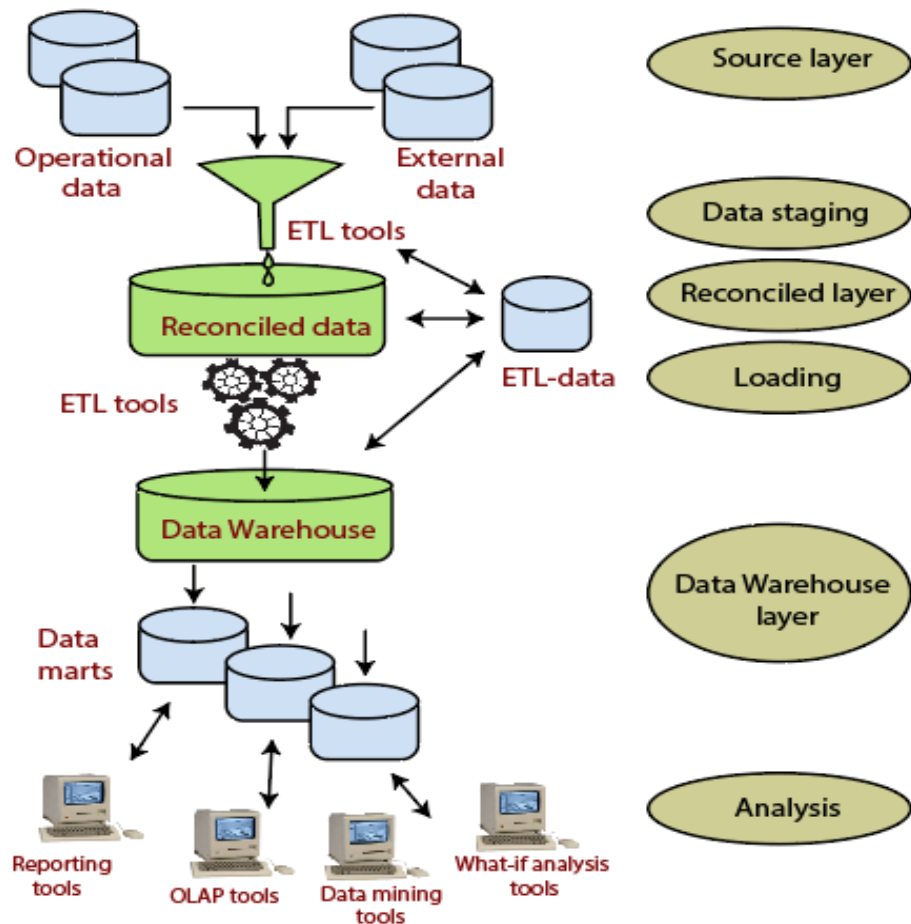

BOTTOM TIER (DATA WAREHOUSE SERVER)

- bottom-tier that consists of the Data Warehouse server
- which is almost always an RDBMS.
- include several specialized data marts and a metadata repository.
- Data from operational databases and external sources (such as user profile data provided by external consultants) are extracted using application program interfaces called a gateway.
- A gateway is provided by the underlying DBMS and allows customer programs to generate SQL code to be executed at a server.

ARCHITECTURE OF DATA MINING SYSTEM

- Examples of gateways contain ODBC (Open Database Connection) and OLE-DB (Open-Linking and Embedding for Databases), by Microsoft, and JDBC (Java Database Connection).

Three-Tier Architecture for a data warehouse system

MIDDLE-TIER

A middle-tier which consists of an OLAP server for fast querying of the data warehouse.

The OLAP server is implemented using either

(1) A Relational OLAP (ROLAP) model, i.e., an extended relational DBMS that maps functions on multidimensional data to standard relational operations.

(2) A Multidimensional OLAP (MOLAP) model, i.e., a particular purpose server that directly implements multidimensional information and operations.

TOP-TIER

A top-tier that contains front-end tools for displaying results provided by OLAP, as well as additional tools for data mining of the OLAP-generated data.

The **metadata repository** stores information that defines DW objects. It includes the following parameters and information for the middle and the top-tier applications:

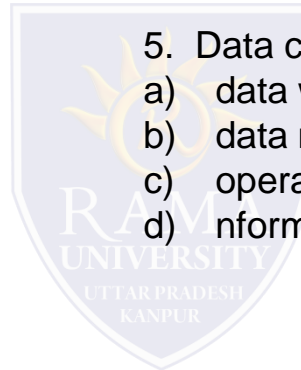

- A description of the DW structure, including the warehouse schema, dimension, hierarchies, data mart locations, and contents, etc.
- Operational metadata, which usually describes the currency level of the stored data, i.e., active, archived or purged, and warehouse monitoring information, i.e., usage statistics, error reports, audit, etc.
- System performance data, which includes indices, used to improve data access and retrieval performance.
- Information about the mapping from operational databases, which provides source RDBMSs and their contents, cleaning and transformation rules, etc.
- Summarization algorithms, predefined queries, and reports business data, which include business terms and definitions, ownership information, etc.

Principles of Data Warehousing

Multiple Choice Question

1. _____ databases are owned by particular departments or business groups.
 - A. Informational.
 - B. Operational.
 - C. Both informational and operational.
 - D. Flat
2. The star schema is composed of _____ fact table.
 - a) one
 - b) two
 - c) three
 - d) Four
3. The time horizon in operational environment is _____.
 - a) 30-60 days.
 - b) 60-90 days.
 - c) 90-120 days.
 - d) 120-150 days.
4. The key used in operational environment may not have an element of _____.
 - a) time
 - b) cost
 - c) frequency
 - d) quality
5. Data can be updated in _____ environment.
 - a) data warehouse.
 - b) data mining.
 - c) operational.
 - d) nformational.
