FACULTY OF ENGINEERING

SOFTWARE ENGINEERING LECTURE-03

Mr. Dharendra

Assistant Professor
Computer Science & Engineering

OUTLINE

- ❖ **Software Development Life Cycle (SDLC)**
- ❖ **Need of SDLC**
- ❖ **SDLC Cycle**
- ❖ **Stages of SDLC**
- ❖ **MCQ**
- ❖ **References**

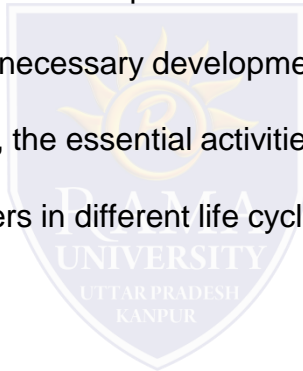

Software Development Life Cycle (SDLC)

A software life cycle model (also termed process model) is a pictorial and diagrammatic representation of the software life cycle. A life cycle model represents all the methods required to make a software product transit through its life cycle stages. It also captures the structure in which these methods are to be undertaken.

In other words, a life cycle model maps the various activities performed on a software product from its inception to retirement. Different life cycle models may plan the necessary development activities to phases in different ways.

Thus, no matter which life cycle model is followed, the essential activities are contained in all life cycle models though the action may be carried out in distinct orders in different life cycle models. During any life cycle stage, more than one activity may also be carried out.

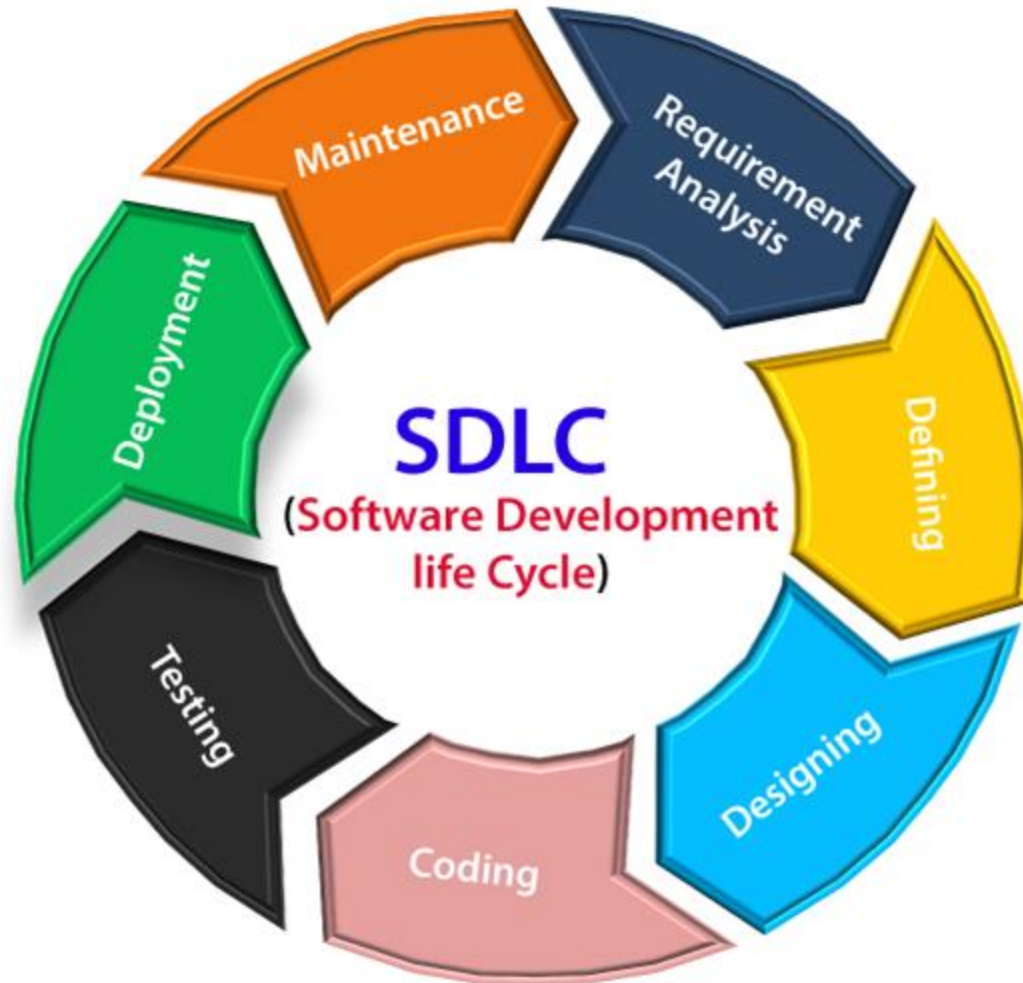

Need of SDLC

The development team must determine a suitable life cycle model for a particular plan and then observe to it. Without using an exact life cycle model, the development of a software product would not be in a systematic and disciplined manner. When a team is developing a software product, there must be a clear understanding among team representative about when and what to do. Otherwise, it would point to chaos and project failure. This problem can be defined by using an example. Suppose a software development issue is divided into various parts and the parts are assigned to the team members. From then on, suppose the team representative is allowed the freedom to develop the roles assigned to them in whatever way they like. It is possible that one representative might start writing the code for his part, another might choose to prepare the test documents first, and some other engineer might begin with the design phase of the roles assigned to him. This would be one of the perfect methods for project failure.

A software life cycle model describes entry and exit criteria for each phase. A phase can begin only if its stage-entry criteria have been fulfilled. So without a software life cycle model, the entry and exit criteria for a stage cannot be recognized. Without software life cycle models, it becomes tough for software project managers to monitor the progress of the project.

SDLC Cycle

Stages of SDLC

Stage1: Planning and requirement analysis

Requirement Analysis is the most important and necessary stage in SDLC.

The senior members of the team perform it with inputs from all the stakeholders and domain experts or SMEs in the industry.

Planning for the quality assurance requirements and identifications of the risks associated with the projects is also done at this stage.

Business analyst and Project organizer set up a meeting with the client to gather all the data like what the customer wants to build, who will be the end user, what is the objective of the product. Before creating a product, a core understanding or knowledge of the product is very necessary.

Stage2: Defining Requirements

Once the requirement analysis is done, the next stage is to certainly represent and document the software requirements and get them accepted from the project stakeholders.

This is accomplished through "SRS"- Software Requirement Specification document which contains all the product requirements to be constructed and developed during the project life cycle.

Stages of SDLC

Stage3: Designing the Software

The next phase is about to bring down all the knowledge of requirements, analysis, and design of the software project. This phase is the product of the last two, like inputs from the customer and requirement gathering.

Stage4: Developing the project

In this phase of SDLC, the actual development begins, and the programming is built. The implementation of design begins concerning writing code. Developers have to follow the coding guidelines described by their management and programming tools like compilers, interpreters, debuggers, etc. are used to develop and implement the code.

Stage5: Testing

After the code is generated, it is tested against the requirements to make sure that the products are solving the needs addressed and gathered during the requirements stage.

During this stage, unit testing, integration testing, system testing, acceptance testing are done.

Stages of SDLC

Stage6: Deployment

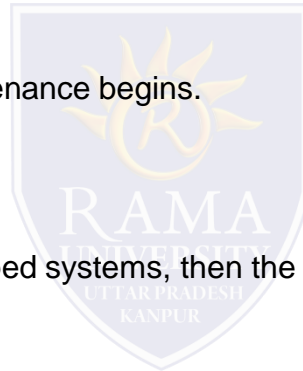

Once the software is certified, and no bugs or errors are stated, then it is deployed.

Then based on the assessment, the software may be released as it is or with suggested enhancement in the object segment.

After the software is deployed, then its maintenance begins.

Stage7: Maintenance

Once when the client starts using the developed systems, then the real issues come up and requirements to be solved from time to time.

1. **The name of programming technique which emphasizes breaking large and complex task into successively smaller sections is:**
 - A). Structured programming
 - B). Micro-programming
 - C). Object orienting
 - D). Scrambling
2. **System implementation phase involve:**
 - A). Parallel runs
 - B). Pilot run
 - C). System checkouts
 - D). All of these
3. **A feasibility study is?**
 - A). Considers a single solution
 - B). Includes a statement of the problem
 - C). Both (a) and (b)
 - D). None of these

4. At the time of system study, flow of charts are drawn using:

- A).** General symbols
- B).** Abbreviated symbols
- C).** Specific symbols
- D).** Non standard symbols

5. A graphic representation of an information system is called?

- A).** Data flow diagram
- B).** Pictogram
- C).** Flowchart
- D).** All of these
