DEPARTMENT OF BIOTECHNOLOGY

PCR (POLYMERASE CHAIN REACTION)

- PCR was developed by Kary Mullis in 1985 and was awarded with the nobel prize in 1993.
- PCR machine also known as Thermocycler.
- PCR is a invitro technique to amplify a specific region of a DNA strand from a small amount of DNA.
- Small amount may be as sample like a drop of blood, semen strains, single hair, vaginal swabs etc.

There are two methods to amplify DNA

- 1.Cloning
- 2.PCR

Requirements to prepare reaction mixture for the PCR

- 1.DNA Template
- 2.Primers
- 3.Taq polymerase
- 4.Deoxynucleoside triphosphates(dNTPs)
- 5.Buffer solution
- 6.Divalent cations(eg.Mg²⁺)
- 7.Nuclease free water

Stages for the PCR reaction: There are three main stages to perform PCR.

- 1.Denaturation
- 2.Annealing
- 3.Extension

The image shows two Eppendorf tubes against a dark blue background. On the left is a large, clear, empty Eppendorf tube. On the right is a smaller, clear Eppendorf tube containing a small amount of clear liquid. The cap of the smaller tube is slightly ajar. A white rectangular label with blue text is positioned above the smaller tube, and another white rectangular label with blue text is positioned below it.

Eppendorf's tube

**Mix DNA, primers,
dNTPs, Taq, buffer, Mg²**

Thermal cycler

Denaturation at 94°C which lasts for 1 min

Annealing at 54°C which lasts for 1 min

extension at 72°C which lasts for 2 min

PCR (POLYMERASE CHAIN REACTION)

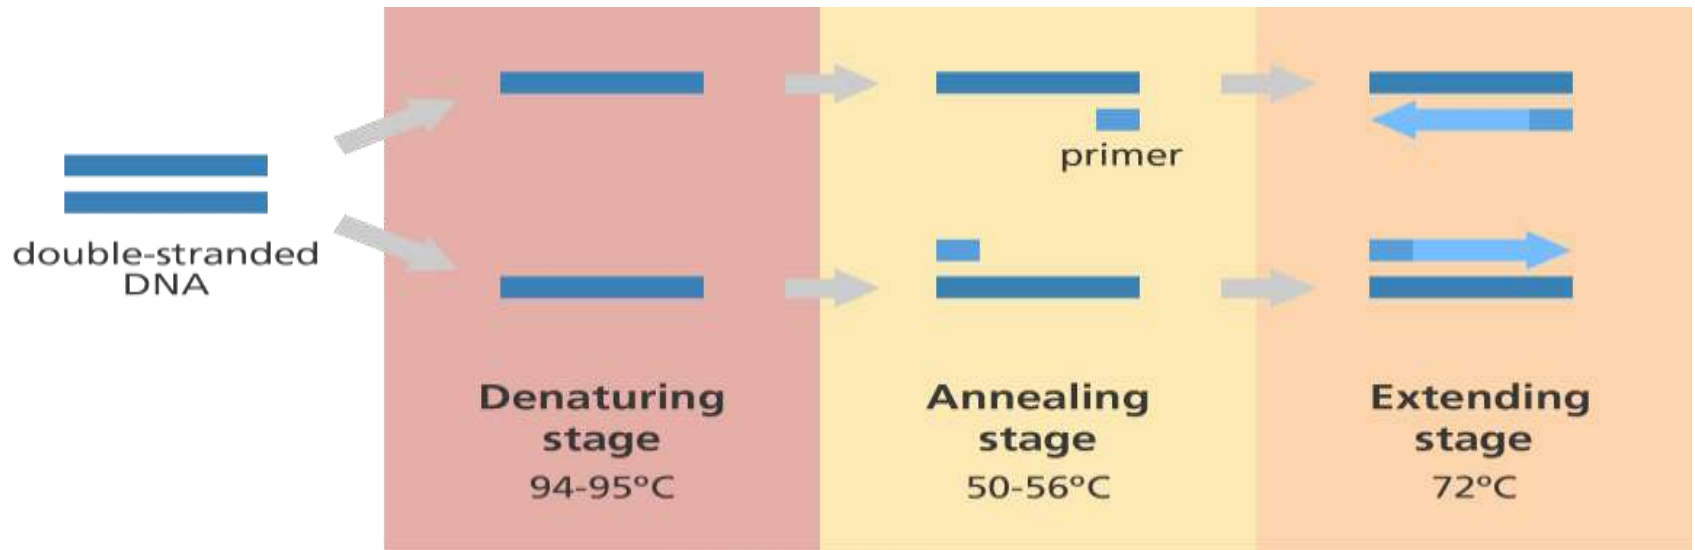

Image taken from yourgenome.org

Types of PCR

- ❖ Overlap extension PCR
- ❖ Reverse Transcription PCR (for the c-DNA synthesis)
- ❖ Real Time PCR
- ❖ Assemble PCR
- ❖ Helicase dependent amplication
- ❖ Intersequence-specific PCR(ISSR)
- ❖ Ligation-mediated PCR
- ❖ Methylation –specifin PCR
- ❖ Miniprimer PCR
- ❖ Multiplex PCR
- ❖ Nested PCR
- ❖ Solid phase PCR
- ❖ Touch down PCR

PCR (POLYMERASE CHAIN REACTION)

Applications of PCR:

- ❖ In clinical diagnosis
- ❖ In DNA sequencing
- ❖ In forensic medicine
- ❖ In Gene manipulation and expression studies
- ❖ In comparative study of genomics
- ❖ In comparison with gene cloning
- ❖ In gene detection
- ❖ In pathogen detection
- ❖ In inherited genetic disorder

Limitations of PCR:

- ❖ Sequence Information can not be obtained.
- ❖ Can not get the information regarding amplicon
- ❖ Error rate during amplification
- ❖ Sensitivity to inhibitors
- ❖ Contamination
- ❖ Artefacts
